A pneumatic system needs five basic components to make, store, control, move, and use compressed air: A compressor —makes air. A reservoir (or receiver)—stores air. One or more valves —control air. A circuit —moves air between the other components. An actuator or motor —uses air to do something.

An Introduction to Pneumatics - SLS Bearings

The two basic types of actuators are cylinders, which generate linear motion, and motors or rotary actuators, which generate rotary motion. Most pneumatic circuits contain a source of compressed air, a pressure control device, conductors such as pipe or tubing, an actuator, and a directional control valve to control the operation of the actuator.
