Recently, the wood industry and design community completed the development of a load and resistance factor design (LRFD) specification for wood construction. The NDS is based on what is termed allowable stress design (ASD), wherein allowable stresses of a material are compared to calculated working stresses resulting from service loads.

to the allowable stress design (ASD) methodology for wood. These case studies indicate that load combinations, as permitted by LRFD, can lead to greater efficiencies in wood design. For multi-story structures, where components such as load-bearing studs and headers are designed for multiple transient live loads, this could be significant. Case Studies

LRFD versus ASD for Wood Design - American Wood Council

The typical structural elements in a wood-framed building system are described below. Rafters (Figure 1.3): These are usually sloped sawn-dimension lumber roof beams spaced at fairly close intervals (e.g., 12, 16, or 24 in.) and carry lighter loads than those carried by the roof trusses, beams, or girders.
